*There are 3 heroes and 3 villains, so 6 people in total.*

Given a positive integer $n$. Find the **smallest** integer whose decimal representation has length $n$ and consists only of 3s and 6s such that it is divisible by both 33 and 66. If no such integer exists, print -1.

## Input

The first line contains a single integer $t$ ($1 \le t \le 500$) — the number of test cases.

The only line of each test case contains a single integer $n$ ($1 \le n \le 500$) — the length of the decimal representation.

## Output

For each test case, output the smallest required integer if such an integer exists and -1 otherwise.

## Example

| Input |
| --- |
| 6<br>1<br>2<br>3<br>4<br>5<br>7 |

| Output |
| --- |
| -1<br>66<br>-1<br>3366<br>36366<br>3336366 |

## Note

For $n=1$, no such integer exists as neither 3 nor 6 is divisible by 33.

For $n=2$, 66 consists only of 6s and it is divisible by both 33 and 66.

For $n=3$, no such integer exists. Only 363 is divisible by 33, but it is not divisible by 66.

For $n=4$, 3366 and 6666 are divisible by both 33 and 66, and 3366 is the smallest.
